Network Server: Determining Filesystem Usage (2/97)

===

Article Created: 27 February 1997

TOPIC ---

How can I determine how full filesystems are on an Apple Network Server?

DISCUSSION --

Typing the following command in an AIX command shell will return the number of blocks, number of blocks free, and percent used in each mounted filesystem.

df -k

As a general rule of thumb, any filesystem more than 90% full should be expanded to avoid potential problems. A full filesystem can result in a server crash.
