Apple IIGS System 3.1: How to Make It Come Up Into The Launcher

=====

This article last reviewed: 11 January 1988

To get the Apple IIGS System Disk version 3.1 to come up into the Launcher, rather than in the Desktop:

1. Open the SYSTEM folder.
2. Rename START to STARTOLD.
3. Rename LAUNCHER to START.

Under ProDos 16, the file named START runs before any of the .SYSTEM files can execute. The Apple IIGS will now start up and run the new START file first, skipping the IIGS Finder.
