Apple Peripherals & Drivers: Advantage over Third-Party Products

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What's the advantage of using an Apple printer instead of one from another manufacturer?

DISCUSSION -----

The Macintosh operating system uses drivers for connecting peripheral devices such as printers. At this time, Apple provides drivers only for its own peripherals, not for third-party products.

Some third-party developers have opted to create drivers for non-apple printers. In most cases these drivers work well. Not all printers or drivers have the same capabilities that our drivers and printers have, while others may have more.

Most software developers develop their software to be compatible with our drivers, but not necessarily with third-party drivers. By sticking with Apple products, you are assured a greater compatibility with off-the-shelf software.
