7.5.5 SCSI Server Update Read Me (4/97)

=====

Article Created: 13 February 1997
Article Reviewed/Updated: 23 April 1997

TOPIC -----

This article is the 7.5.5 SCSI Server Update ReadMe file.

DISCUSSION -----

7.5.5 SCSI Server Update

This extension has been created to resolve a bug that could cause a server to hang when a client computer performed a find file search on a server volume. This extension is only for use on PowerPC Apple Workgroup Servers running AppleShare 4.2.x and System 7.5.5.

This is intended for use with PowerPC NuBus- and PCI-based Workgroup Servers, AppleShare 4.2.x, System Software version 7.5.5, and Open Transport 1.1.1. They have undergone extensive testing and together are fully compatible. Installation of the PowerPC Interrupt Extension is also recommended.

NOTE: 7.5.5 SCSI Server Update is designed for use only with System 7.5.5, and only with Apple Workgroup Servers. Customers with computers that are not Apple Workgroup Servers will receive no benefit from installing this extension.

IMPORTANT:

It is important that the instructions provided in this document are followed in the order written. If you encounter problems with this installation, you may have to perform a clean System Software installation and reinstall all of the listed software in the order presented below.

Instructions for installing 7.5.5 SCSI Server Update 1.0

- 1) As a precaution, Apple recommends performing a complete backup of the server

volumes with a third-party backup utility before installing this patch.

2) Locate your "Workgroup Server Software" CD-ROM disc. Boot the Macintosh or Workgroup Server from the bootable CD by holding down the C-key while the server is starting up. You can verify that the CD is the boot volume by checking for its icon in the uppermost position on the desktop.

3) Use the Disk First Aid program to verify and, if necessary, repair all volumes. Disk First Aid should be run from the CD (located in the Utilities folder on most System Software CD-ROM discs). Do not install this patch if any drive cannot be repaired.

4) Install the Mac OS System Software 7.5.5 Update.

If you do not have this patch, you can download it from <http://www.info.apple.com/swupdates/>

The software is located at the following path:

US

Macintosh
System

NOTE: Please read the Read Me files that are included with all system software patches to ensure installation is performed correctly. Note that "SCSI Update 1.0" requires Mac OS 7.5.5 to be running on the computer.

5) Install Open Transport 1.1.1 if it is not already installed. Use Network Software Selector to switch over to Open Transport. (This is located in your Apple Extras folder.)

6) Install the 7.5.5 SCSI Server Update extension by dragging it to a closed System Folder. Click OK when asked to place the extension in the Extensions folder.

7) Install the PowerPC Interrupt Extension by dragging it to a closed System Folder. The extension will automatically be placed in the Extensions folder.

If you do not have this extension, you can download it from <http://www.info.apple.com/swupdates/>

The software is located at the following path:

US

Macintosh
System
Other_System

8) Restart the server.

9) Proceed with the regular launching of the AppleShare File Server application.

IMPORTANT:

If you have any problems with any of the above steps, please call the AppleAssist Technical Support center for help. The number to call is in your Apple Service documentation included with your server.
